Introducing our new, super strong, Servo Hub Horns. These new horns are machined from 6061 T6 aluminum and tapped with (4) 5-40 holes and (4) non-tapped countersunk (from the bottom) holes. They mate up perfectly with our wheels and gears that utilize the same hole pattern. Designed to work with standard Hitec or standard Futaba splines. Will not work on the HS-800 series servos at this time.

**Features:**

- (4) 5-40 tapped holes
- (4) #5 Countersunk Holes
- Fits directly to servo spline
- Machined from 6061 T6 Aluminum
- Available for both Hitec & Futaba  
(Standard Size Splines)

(4) #5 holes are countersunk from the backside to allow countersunk screws to protrude through the top as shown above.

The [tube clamp hub](#) is attached to the servo hub.

Servo Hub mounted on HS-785HB

Attached to a Futaba S3004 Servo.

Attached to Heavy Duty servo arm.

Servo hub works great for mounting our foam wheels directly to a servo.

Being able to run screws from the bottom allows a variety of attachments.
